

LADYBŪD

Founded in 2018 in order to help every person experience the power and potency of hemp-derived products. We work together with experts in the field to create cannabinoid infused formulations .

All of our products use only ingredients that are found in nature. There are NO chemicals in any of our botanical balms, tincture's, body butter, blush, facial serums, or soaps.

So what is the key to our success? We strive to make the purest, natural products. Using only the best organic & natural compounds, that are safe and promote a state of well being, because we care about what goes on & in our bodies!

PROMISING CANNABINOID POSSIBILITIES

CBGA, CBG, CBDA, CBD

CBGA Cannabigerol Acid can help with co-morbidities and complications in disorders relevant to the heart or blood sugar, or more specifically, complications that lead to oxidative stress. Also, by stimulating the lipid metabolism and reducing excess lipid accumulation, CBGA can be a great asset in the regulation of the metabolism. This phytocannabinoid can also be extremely helpful in maintaining healthy cellular activity of the bowels, rectum, and colon (especially the colon).

CBG Cannabigerol: This cannabinoid is particularly interesting because it has shown to be especially effective in reducing pressure around the eyes. It is also an asset in matters of blood pressure and neuroprotection, an effect that may result in salvage, recovery or regeneration of the nervous system, its cells, structure and function.. In mice, this cannabinoid has helped with the regulation of the gut. CBG is known to kill or slow bacterial growth, reduce inflammation, (particularly in its acidic CBGA form,) inhibit cell growth in tumor/cancer cells, and promote bone growth. CBG is the only cannabinoid identified that helps stimulate the growth of new brain cells.

CBDA Cannabidiolic Acid is not interchangeable with CBD. They're different compounds, although they do have a close relationship. CBDA is a non-psychoactive compound that serves as a precursor to CBD. CBDA is in the very early stages of research but shows just as much, if not more, promise than CBD. Promising studies show that CBDA is more effective at reducing nausea than CBD. act as an effective anti-inflammatory agent. CBDA affects the body's serotonin receptors. Additionally, research has shown that CBDA is more effective than CBD when it comes to convulsions and malignant cell migration (especially of the breast).

CBD Cannabidiol Studies have shown that CBD may help reduce chronic pain by affecting endocannabinoid receptor activity, reducing inflammation, and interacting with neurotransmitters. Some research suggests that CBD may be effective for certain types of pain, including nerve pain and back pain, when used on its own. Promising studies with Alzheimer's as well as Schizophrenia, & Epilepsy, however, it seems to be most effective when combined with THC. This is because THC binds with the body's CB1 & CB2 receptors.
